Analysis

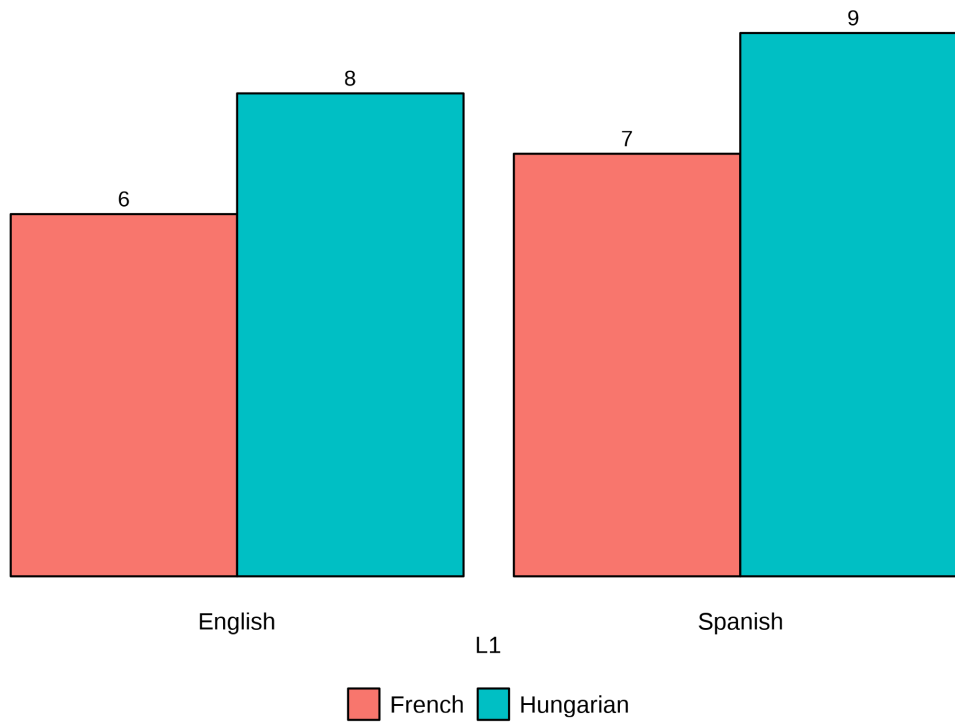

- Detail categorization procedure

Results

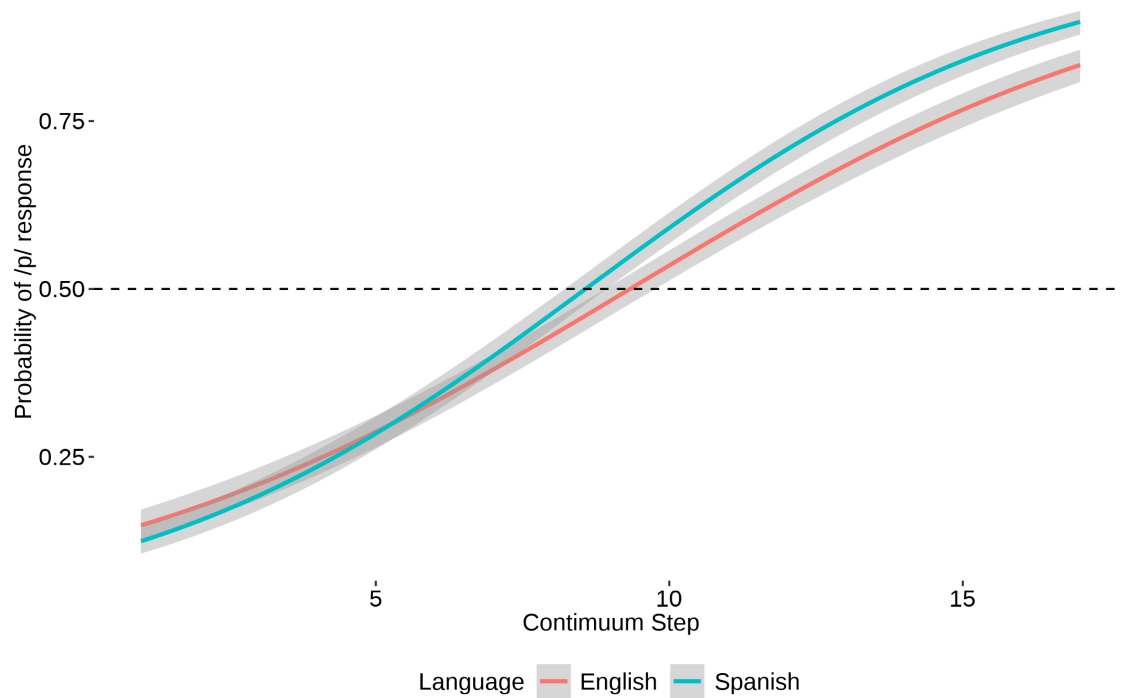

Figure 1 shows the breakdown of participant categorizations. Half of the participants showed evidence of a DPBE, making them appropriate for subsequent within-subjects analyses. The 30 participants with no effect were not include in the within subjects-analysis, which was designed to determined which language-specific phonemic boundary is more similar to a novel language's, since their Spanish and English was not distinct (enough) to determine whether their “L3” was closer to one or the other.

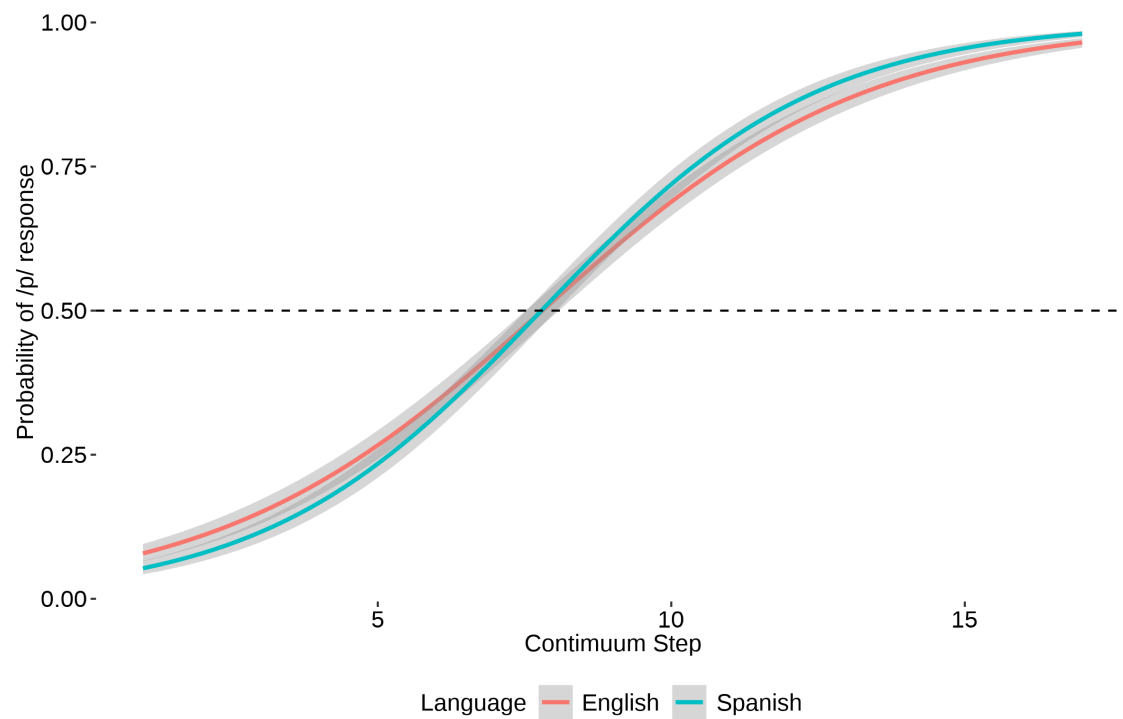

Breakdown of L1 and “L3” for participants with the DPBE

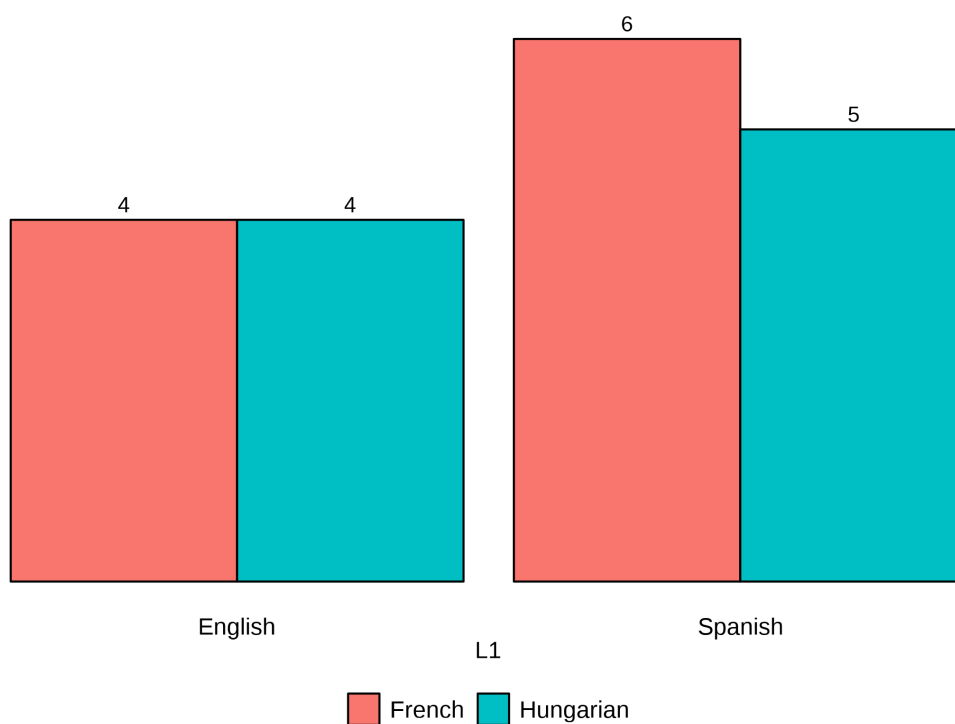

Group-level S-shaped curve for all 30 DPBE ppts

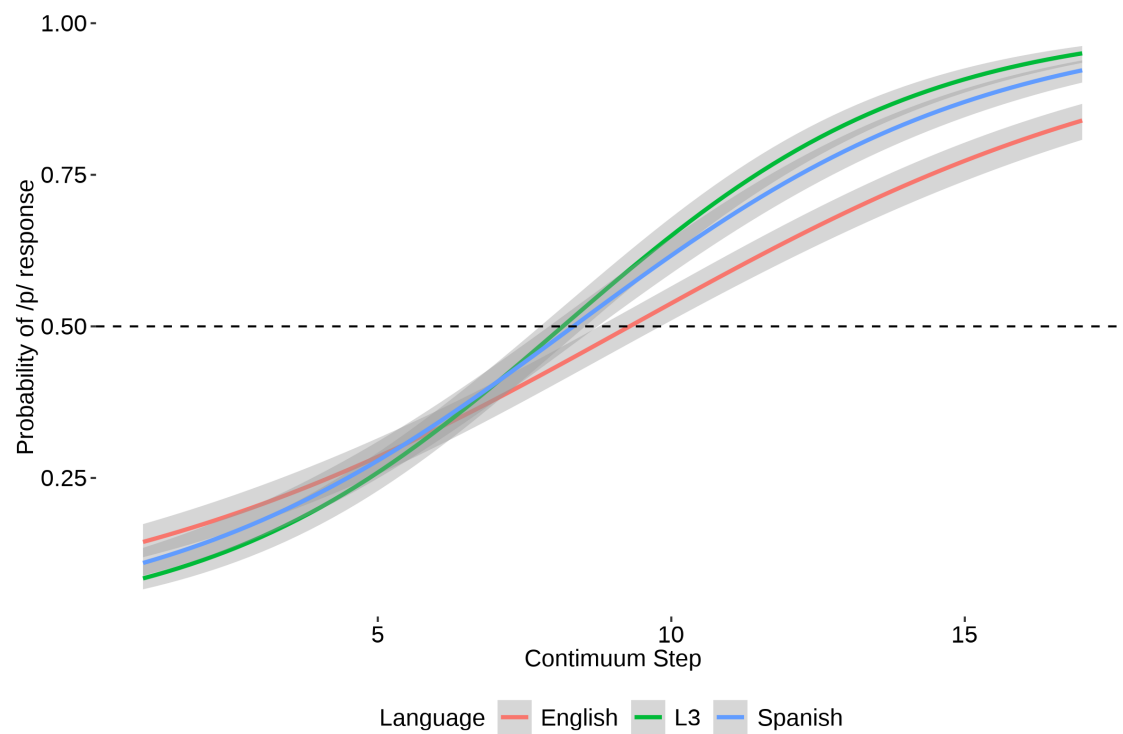

Group-level S-shaped curve for all 31 non-DPBE ppts

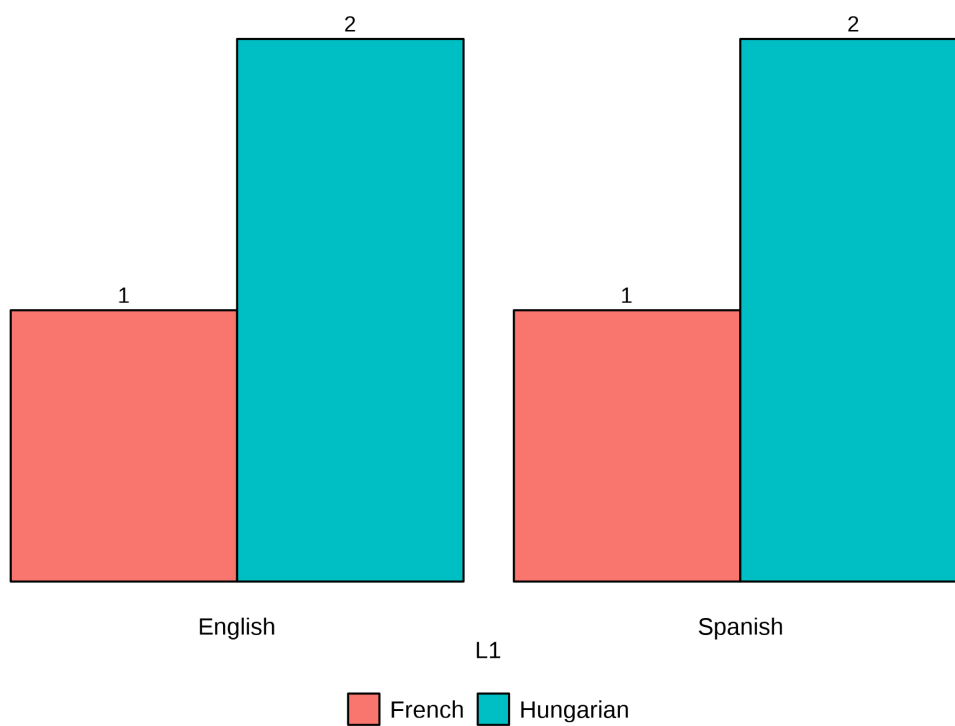

Breakdown of L1 and “L3” for participants with a Spanish-like L3

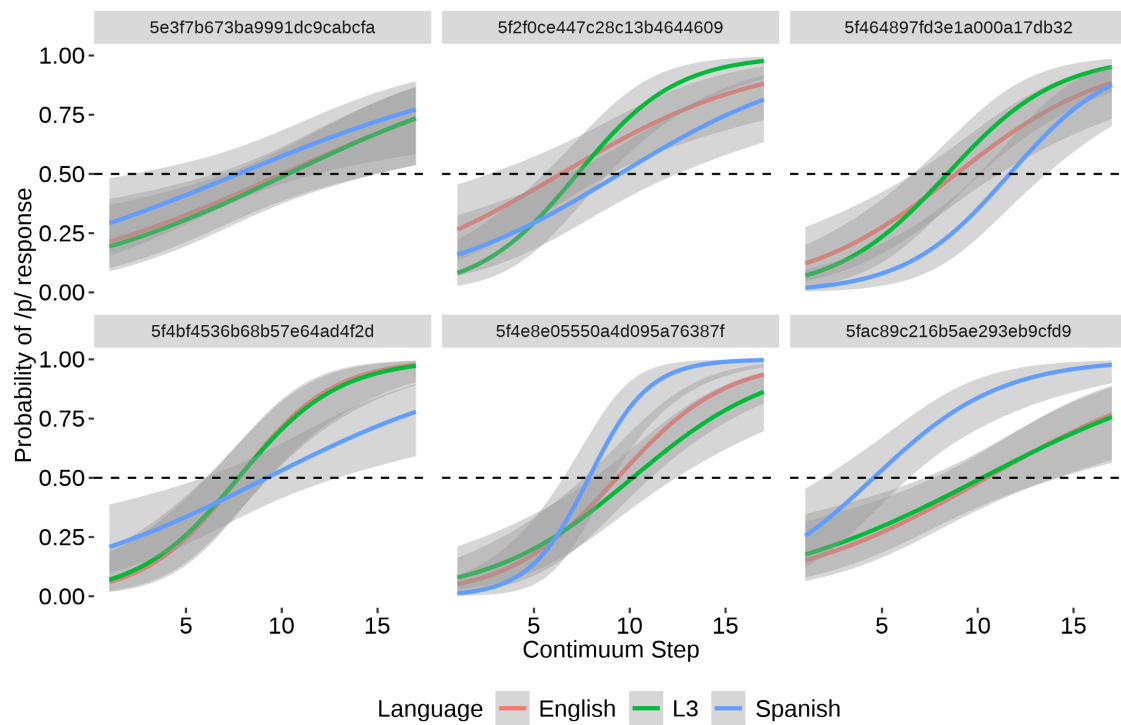

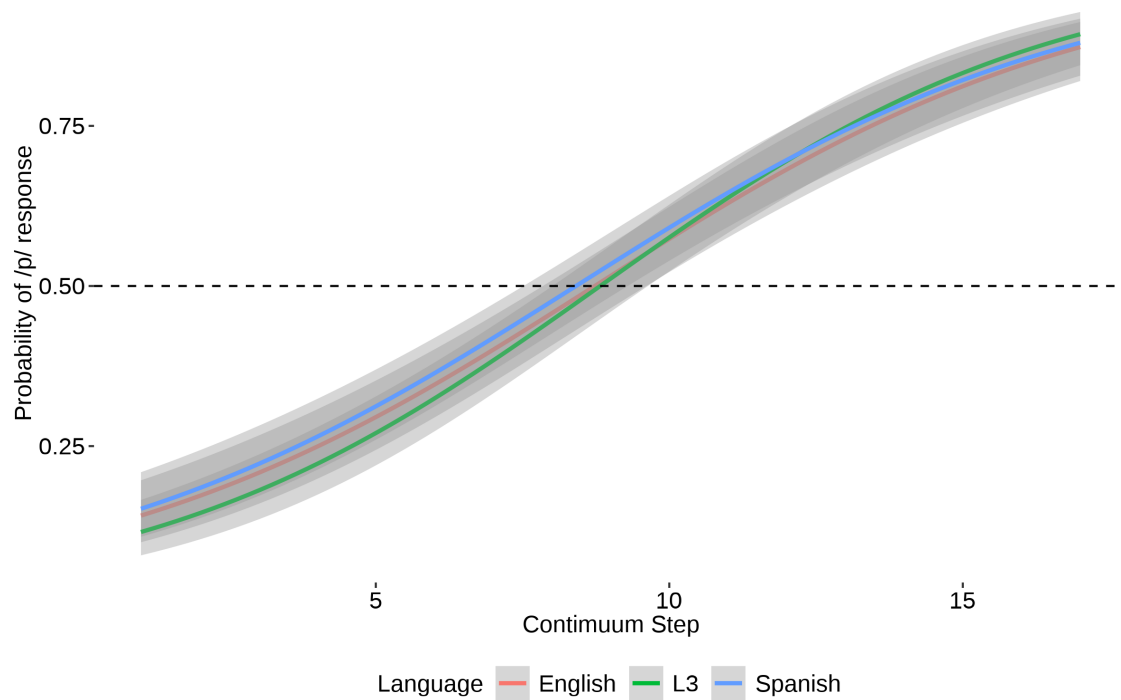

Group-level S-shaped curve for all Spanish-like boundaries

Breakdown of L1 and “L3” for participants with a English-like L3

Group-level S-shaped curve for all English-like boundaries

Supplementary plots

N/A participants who had more than one continuum step between both their L3 and L1/L2 and was not intermediate of them both.
